

Smart planning software for fuel deliveries

Do any of these scenarios sound familiar to you?

- “I’m looking to optimize my planning process, planning routes more efficiently, possible even in real-time.”
- “We’ve got too many instances of customer tanks running dry, and I want to reduce that risk to an absolute minimum without incurring unnecessary costs.”
- “We’re too dependent on a small group of experienced planners who are under a lot of pressure. Is there any way to streamline or even automate the planning process?”
- “We’d like to switch to a VMI model, and I need for software that will allow us to manage our customers’ inventory levels ourselves.”
- “Our planning process hasn’t changed in years, and I’d like to know how the latest software and smart digital tools boost our performance and reduce costs.”

Wouldn’t life be a lot easier if you could work with planning software that can automatically calculate optimal delivery routes, based on your priorities and KPIs? And, when circumstances require it, can even adjust a planning in real-time, 24/7?

Bottomline has been developing innovative, user-friendly and high-performing planning software for decades. We know the world of fuel delivery logistics inside out. And we have put all that expertise to good use by developing the industry’s most advanced platform for fuel delivery planning: BX.

The BX platform:

- Uses smart algorithms to forecast inventories and to plan, monitor and reconcile delivery routes
- Has a user-friendly, intuitive interface, visualizing all the data a planner needs in one screen
- Is a cloud-based solution and is easy to implement and connect to your existing systems
- Can continuously recalculate trips and use a wide range of real-time data to optimize them and respond to unforeseen complications
- Offers four subscription plans: from state-of-the art support in manual planning to fully autonomous inventory routing.

How Bottomline's BX software can make life easier for you

- Plan cost-optimal delivery routes in a matter of minutes
- Relieve the pressure on your planning teams by letting algorithms do the heavy lifting
- Get the most out of your VMI delivery model by generating precise forecasts, optimal drop sizes and a wide range real-time data
- Monitor, optimize and reroute deliveries in real-time, even outside office hours
- Get ready for fully autonomous, 24/7 delivery planning

We are looking forward to talk to you!
